Garrison Dental Solutions Enhances Quad Matrix System with Updated Quad Wedges™

Spring Lake, MI – Garrison Dental Solutions has announced important enhancements to its Quad Matrix System with the release of updated Quad Wedges™, building on the system's strong clinical adoption for complex Class II restorations.

The Quad Matrix System was developed to help clinicians address challenging scenarios such as back-to-back restorations, deep gingival margins, and multi-tooth Class II cases. Featuring clinician-inspired design and extensive validation, the system combines Driver-Tip Quad Rings for advanced adaptation with a full range of firm and dead-soft bands to support ideal contour and contact formation.

The newly refined **Quad Wedges™** strengthen the system's performance with improvements driven by clinician feedback. Updates include a firmer material for greater durability, a redesigned gripping block for more secure placement, and enhanced tip geometry that allows smoother insertion in tight contacts. The wedges maintain their signature split-tip design, which adapts simultaneously to both cervical margins to reinforce sealing, now with improved performance in wider interproximal spaces.

The enhanced Quad Wedges and complete Quad Matrix System are available through authorized distributors and at garrisondental.com.

About Garrison Dental Solutions

For more than 25 years, Garrison Dental Solutions has led the way in sectional matrix system innovation. Designed in partnership with clinicians and backed by engineering excellence, Garrison's solutions enhance restorative outcomes and streamline clinical workflow for dental professionals worldwide.
